

Application Code Update

New PinPoint® II Code Revisions

Effective: October 1, 2018

CapView: v4.18
Power Hub: v2.55
VCM: v2.41

This version of code is only compatible with PinPoint® II

TOP FEATURES

- Ability to save Nozzle Setup profiles and System Setup values independent of Location Setup which makes replacing components easier
- 24 Series valve compatibility without changing the boom configurations
- Improved overlap control in narrow overlap areas
- Gallon counters now work correctly with recirculation systems

FEATURES/ENHANCEMENTS

- Full System configurations (includes Location Setup, System Setup, and Nozzle Setup information) can be reloaded via USB thumb drive or just the System Setup and Nozzle Setup information.
 - This allows system components to be replaced and a Factory Reset and Location Setup to be done and then all the machine specific information can be loaded via the USB to maintain pump/pressure/flow control information and GPS information along with the custom boom settings for fence rows, wheel tracks, etc. so that information does not have to be re-entered.
- Faster Overlap Processing time that allows for more nozzles.
- Up to 200 valve capability for larger booms or tighter nozzle spacing.
