

FAQ

General Questions:

How does N-Vision work?

N-Vision removes naturally occurring vapor from the tank and plumbing to provide liquid state ammonia to the metering device.

Does N-Vision tell you when you are over running your application?

Yes. N-Vision shows the operator real-time demand and capacity based on application conditions, field terrain, and tank performance capacities. This results in a consistent application throughout the entire tank. Know exactly when to speed-up or slow-down based on supply

Will N-Vision allow me to go further on a tank?

Yes. N-Vision allows you to pull supply tanks dry with confidence. Removing vapor and tank feed diagnostics result in 15% more usable product per tank increasing application efficiencies.

Does N-Vision have a filtration system?

Yes. N-Vision features a large 3D depth filtration multi-layered particle filter that exponentially extends time between services while keeping downstream components free of debris and contaminants.

Does N-Vision Tell if you if you have a flow restriction or blockage?

Yes, with the simple in cab interface, there are three LEDs to indicate system status. If there is a problem in the flow from the tank to the N-Vision the display will alarm and show a red light indicating there is a flow issue.

How long does this take to install?

N-Vision installation can be done in approximately a few hours depending on mounting and plumbing configurations.
